TRUST

Out of the question....?

High Trust

Medium Trust

Low Trust

What This Teaches Us About Trust

- Trust is contextual
- Trust is earned
- Trust is dynamic

TRUSTY

GOVERNANCE

Hidden Insight

**Fully governing data before
delivering AI is not realistic.**

Trust model

/ˈtrəst ˈmä - dəl /

noun

A dynamic inventory of data, categorized by value and risk, that assigns a trust rating based on the lineage and curation.

Trust Model definition (D&A context)

Gartner definition:

A trust model provides **discrete and graduated levels of governance oversight and control** of D&A assets, allowing these to be understood in terms of:

- Business context (value/risk)
- Trust (lineage/curation).

❖ How does it work?

	CRM			ERP		Analytics			EDW	AI	External sources	
	Prospect data	Contracting & pricing app data	Customer master data	Procurement Application data	Procurement master data	Information portal	KPI framework	Prediction model	Corporate data warehousing	Machine learning Algorithms	Web feeds	Geospatial data
Trust level												
Assured			X		X	X	X		X		X	
Affirmed	X	X		X								X
Proven								X		X		
Acknowledged												
Asserted												
Unknown												

Identify the sufficient number of trust levels

Identify the data and analytics artifacts

Assess where you currently are

Identify the acceptable trust level

Why do you need this?

- Organizations with trust models:
 - - 64% more success in compliance
 - - 48% better at cost optimization
- AI governance demands explicit trust mechanisms

How can you implement a Trust Model?

- A *trust score* from 0 to 100
- Measures the *trustworthiness*
- Calculated by simple logic based on governance enforcement

Description

Description

The table contains data related to sales orders, including details about the reseller, employee, product, and various financial metrics. Use cases include analyzing sales performance, tracking order fulfillment timelines, and assessing the impact of discounts and taxes on sales revenue. Key information includes order dates, shipping dates, and amounts associated with each sale.

❖ *Governed tags (beta)* prevent manipulation

The screenshot displays the Databricks workspace interface. At the top left, the 'Catalog' tab is highlighted with a red box. Below it, the 'Serverless Starter Warehouse' is selected. A search bar with the placeholder 'Type to search...' and a filter icon is present. The 'Quick access' section, also highlighted with a red box, contains buttons for 'Recents', 'Favorites', and 'Catalogs'. To the right, the 'Governed Tags' button is highlighted with a red box. The main content area shows the 'Description' of a table, which includes details about sales orders and financial metrics. On the right side, the 'About this table' section provides metadata such as the owner (hansg@infosupport.com), type (Managed), data source (Delta), and popularity. At the bottom right, the 'Tags' section shows a lock icon and a 'Trust Score: 75'.

6	\# users (28d)	183

Use Case: Databricks (Free Edition)

- How Databricks addresses the trust challenge
- Unity Catalog + automated trust scoring
- A 'credit score' for your datasets

How does the scoring model work?

- Score based on 3 domains:
-  Documentation (30 pts)
-  Reliability (48 pts)
-  Governance (22 pts)

Trust Score Architecture

From score to action

- Scores → Tags in Unity Catalog

- Automatic propagation to dashboards

- Consumers see 'low trust' warnings

DEMO

Platform-agnostic approach

- Also applicable in Microsoft Fabric using Purview
- Requirements:
 - Metadata
 - Automated checks
 - Tagging or classification system

Conclusions

- Trust must be measurable, scalable, and actionable
- Trust model + automation = workable governance
- Start small, think big, automate early

Q&A

- “If you can’t measure trust, how can you govern data?”
